1. How the table works

Every dish is described once. Two kinds of columns sit side by side. **Menu columns** are filled by the owner or supervisor when adding or editing a dish — they drive the chatbot. **AI columns** are written by the engine itself from sales and conversation data — no human types them.

2. Menu columns

The base fields the owner or supervisor fills for each dish.

Column	Required?	Example & purpose
Item name	Required	“Idly (2)” — what the guest sees on the card.
Price	Required	“Rs. 50” — the order value.
Veg / Non-veg badge	Required	“Veg” — the green / red badge.
Quantity of dishes	Required	“2 pcs” — how many come in a serving.
Short description	Required	“Soft steamed rice cakes with chutney & sambar” — so the AI knows the dish.
Dish timings	Required	“6:30–10:30 AM” — when the dish is served.
Availability	Required	Available / Sold-out / Hidden — what’s orderable now (see §3).
Tags	Optional	“Bestseller, Must-try” — featured cues on the card.
Preparation time	Optional	“~10 min” — guest expectation and kitchen pacing.
Promote	Optional	A timed push the owner sets on a dish (see §3).

3. Two time-bound states

Availability — set per branch to *Available*, *Sold-out* or *Hidden*. ‘Sold-out’ auto-resets the next day so staff never forget to switch a dish back on; ‘Hidden’ stays off until un-hidden. The AI never recommends a sold-out or hidden dish.

Promote — the owner or supervisor taps a dish to push it for a chosen duration (10 min · 30 min · 1 hour · 2 hours · till end of day · until I stop), much like sharing live location with a timer. It auto-expires — nothing to undo — and while it runs the dish is featured at the top of the chatbot’s suggestions.

4. AI columns the engine adds

These are written by the AI from the sales and conversation data — nobody fills them. From the first day of real use (counts and rates, no history needed):

Column	What it tells you
Units sold	How many were ordered (today / 7-day / 30-day).
Revenue	Units × price.
Order share	% of all orders the dish appears in.
Times recommended	How often the AI suggested it.
Acceptance rate	Accepted ÷ recommended — does the suggestion land.
View → order conversion	Ordered ÷ viewed — people look but don’t buy?
Cart drop-off	Added to the cart but not ordered.
Basket lift	Average bill when this dish is in the order.
Most-paired-with	The item it’s most often bought alongside.
Top audience	Which language / segment orders it most.
Peak time	The hour / day-part it sells in.
Sentiment tally	Positive vs negative words guests use about it in chat.
Sold-out count	How often it ran out.
Recency	When it was last ordered.

4. AI columns (continued)

After a few weeks of history (these need a time-series, so they are not available on day one):

Column	What it tells you
Trend	Rising or falling over time.
Forecast	Predicted demand for the coming days.
Reorder rate	Do the same guests come back to it — the strongest vote.
Satisfaction score	Inferred from behaviour and words, per dish — feedback without a form.

5. How the AI decides what to push

Recommendations follow a priority stack, so the owner stays in control and the AI fills the gaps:

- **1 — The guest's actual request** always wins. "Something spicy" is honoured; everything else only refines within it.
- **2 — An active Promote** (the owner's timed push) is boosted to the top while it runs.
- **3 — Otherwise**, the AI leans on what is **profitable** and what fits the **weather** (hot day → cold drinks & ice cream; rain → soup, coffee, bajji), alongside what is selling well and what is in stock. Weather sits just below the owner's push — a nudge, never a rule.

6. Notes

- **Scope.** This sheet lists only the columns decided so far. Further fields can be added later as needed.
- **Status.** This is the design. It comes alive with the database + order logging; today's demo uses a fixed menu and sample-data dashboards.
- **Menu vs AI.** The owner fills the menu columns; the AI columns are generated automatically and are never a human's job.
