

Kitchen System & Order Flow

Annapoorna · dine-in — today's discussion

In this document your ideas and my suggestions are kept separate. Gold = **Ram's idea**. Teal = **Odysra — my take / what we built**. Grey = **Background** (how others do it).

TOPIC 1

The idea — a kitchen & bills dashboard

RAM'S IDEA

“I thought of creating another dashboard for the bills and for the kitchen, for the orders — I think it will be better.”

ODYSRA — MY TAKE

That is exactly a **Kitchen Display System (KDS)** + a **billing screen** — standard in every restaurant POS. One prerequisite: orders must first be **saved to the database**. Once they are, the kitchen screen and the bills screen are just two live views of the same order data (and the same data later powers insights).

TOPIC 2

How the existing systems do it

BACKGROUND

A customer orders → one central system → it **splits the order into two streams**: (1) a **KOT** (Kitchen Order Ticket) to a kitchen screen / printer with prep-station tags, and (2) a **running bill**. Kitchen staff tap each ticket New → Preparing → Ready, and the system timestamps every step to measure prep time. (Used by Petpooja, DotPe, etc.) McDonald's self-kiosks are the same idea — many ordering points in parallel. Your QR ordering is a **kiosk on the customer's own phone**: same flow, zero hardware, unlimited ordering points.

TOPIC 3

The Kitchen Display System we built

ODYSRA — WHAT WE BUILT

A live kitchen screen: tickets showing token/table, items + modifiers (“less spicy”), a running timer, colour states (blue=new, amber=cooking, green=ready), red pulse for late orders, station filters, and New → Cooking → Ready/Served buttons.

Demo file: **kitchen_display_demo.html** (fast-food style) and **dinein_kitchen_demo.html** (Annapoorna style).

TOPIC 4

Annapoorna is dine-in, not fast food

RAM'S IDEA

“How are we going to do it for Annapoorna — it's not a fast-food restaurant?”

ODYSRA — MY TAKE

Dine-in works differently, so the flow adapts:

- **Table-based, not tokens** — the QR is on the table, so every order carries the table number.
- **Orders come in rounds on one running tab** — idli, then a dosa, then coffee, all on the same bill.
- **A “Serve to table” step** — when ready, floor staff get a cue to carry it over (food isn’t self-collected).
- **Pay at the end** — the final table bill (all rounds + GST) is generated when they’re done.

The bot already captures dine-in vs takeaway and the table number, so it serves both.

TOPIC 5

Re-orders & priority — the naan case

RAM'S IDEA

“Imagine a customer ordered naan + paneer butter masala, the naan gets over and he wants more naan — that should get some priority. We get their name and phone when they order, which auto-signs them in.”

ODYSRA — MY TAKE

Agreed — a refill/add-on for a guest **already eating** should be expedited (his food is getting cold, and naan is quick). On the kitchen screen it **jumps to the top with a ■ EXPEDITE flag**; brand-new tables stay in the normal queue. **Rule:** expedite if it is a re-order AND the previous round is already cooking or served. It's a strong nudge to the front, not an absolute override — the tandoor has limited capacity, so the supervisor still sees the full board.

TOPIC 6

How we know it's a re-order — phone + table logic

RAM'S IDEA

“Let's track through the same phone number and the same table number.”

ODYSRA — MY TAKE

We keep an **open “tab” (session) per table** = {table, phone, status: open/paid, rounds}. On every order:

- Read the **table number** (from the QR) and the **phone** (from sign-in).
- **Open session for this table + phone?** No → new order, Round 1. Yes → re-order, Round 2+ on the same bill.
- If re-order and the **previous round is cooking/served** → ■ expedite.
- On **payment** → close the session. The next visit starts fresh at Round 1.

Table = **where** (the tab lives here). **Phone** = **who** (links the rounds, and recognises the person on future visits).

TOPIC 7

Recognising regulars across visits

RAM'S IDEA

“Customers ordering again must be identified and given a little priority / something extra.”

ODYSRA — MY TAKE

The **phone number** is the key. When a number is seen again: greet by name, offer a one-tap “**your usual**” re-order, a loyalty reward every Nth visit, and a ★ **Regular** badge on the kitchen/supervisor screen for a little extra care. (This across-visit loyalty is separate from the within-meal expedite in Topic 5.)

TOPIC 8

The business model

RAM'S IDEA

“Does our product work like a product-to-services model?”

ODYSRA — MY TAKE

Yes — it's **Product-as-a-Service (SaaS)**. The **product** is the chatbot + dashboards + kitchen screen they use; the **service** is the AI brain on our servers, plus updates and insights, paid continuously (subscription / credits). **Body = product, soul = service**. Stop paying and the soul goes silent — so we earn every month, not once.

TOPIC 9

What to build next (to make it real)

ODYSRA — NEXT STEPS

In order:

- **Save every order + status** to the database (with table, phone, round, timestamp).
- Add the **open-tab session logic** (Topic 6) so re-orders are detected automatically.
- Point the **kitchen screen** at live orders (with the ■ expedite flag).
- Build the **bills screen** (open tabs per table, GST, settle).
- Layer on **regular recognition** + “your usual”.

Your ideas set the direction; my job is turning each one into how it actually runs. — Odysra
