June 2026

Confidential — prepared for discussion with Sree Annapoorna.

1. Abstract

The Sree Annapoorna AI Waiter is a web-based digital waiter: guests browse the full menu, order by tapping, typing or **speaking in six languages**, and check out — from any phone, with no app to install. It recommends dishes, takes orders into a cart, collects feedback, and gives each outlet its own link and QR code. It is inexpensive to run — browsing and tap-ordering use no paid services; AI and voice cost money only when a guest actually chats or talks.

2. What It Offers

- **Full menu** — all 188 dishes with prices, categories, bestseller tags, a green pure-veg badge and a one-tap Add.
- **Voice ordering** — speak in your language; words appear live and the order is understood.
- **Chat ordering** — “two idli and one dosa” or “suggest something light” simply works.
- **Six languages** — English, Tamil, Hindi, Malayalam, Telugu and Kannada, across menu, chat and voice.
- **Smart cart** — quantity controls, kitchen notes, a “2 or 1?” portion check, and drink suggestions.
- **Checkout** — dine-in or takeaway, table to AC/Non-AC tax, name and WhatsApp number; bill & payment ready to connect.
- **Feedback by topic** — food, service, cleanliness, ambience and more, with stars and a message.
- **Per-branch links & QR** — e.g. order.annapoorna.com/rs-puram opens straight into that branch.

3. How It Works

Open the branch link or scan the table QR → pick a language → browse the menu or simply say what you want → items collect in the cart with quantities and notes → check out (dine-in/takeaway, table, contact) → leave a quick topic-based rating.

4. What Annapoorna Gains

For the business, the AI Waiter is far more than a digital menu — it is a tireless front-of-house teammate that sells, serves and listens at every table.

- **A waiter at every table, instantly.** Guests order and ask about any dish without waiting — faster service and quicker table turnover, even at peak hours.
- **Bigger bills, naturally.** Honest recommendations and drink & combo suggestions lift the average order value, with no pushy selling.
- **Every guest, in their language.** Tamil, Malayalam, Hindi, Telugu, Kannada and English — tourists and out-of-state guests order with ease.
- **Less load on staff.** Routine ordering and menu questions are handled automatically, easing rush hours and staff shortages so the team can focus on hospitality.
- **A built-in marketing channel.** Promote today's specials, festival offers and new dishes right inside the chat and on each branch's QR — usable on tables, bills, social media and campaigns.
- **Feedback on autopilot.** Every guest can rate food, service and cleanliness, so problems surface early and strengths are known.
- **Insight that compounds, and a modern brand.** Everyday orders become data on what sells, when and to whom (see Section 8) — and a polished AI waiter signals that Annapoorna leads on experience.

5. Technology

Layer	What we use	Notes
Hosting & domain	Annapoorna's own web hosting & domain	Runs on Sree Annapoorna's own address & account.
AI assistant	Google Gemini 2.5 Flash	Understands orders & recommends, grounded on the menu.
Voice (speech to text)	Sarvam AI — Saarika	Built for Indian languages; accurate Tamil & more.
Front-end	Self-contained web app	Runs in any phone browser; nothing to install.

6. Deployment & Ownership

The waiter runs on Sree Annapoorna's own domain (for example, order.annapoorna.com) and Annapoorna's own accounts, so the experience and the running costs are fully Annapoorna's. Odysra builds, deploys and maintains it. What Annapoorna provides — most of which it already has:

- **A domain** — its existing website domain (a sub-address is enough; a new one is about Rs. 1,000 a year).
- **Web hosting** — an account in its name (often free at low volume, scaling modestly with traffic).
- **A Google Gemini account** — the assistant's brain.
- **A Sarvam account** — the voice (speech-to-text for Indian languages).

The per-use AI and voice rates are the same on any domain; deploying on Annapoorna's address simply means Annapoorna holds the accounts and is billed directly.

7. Running Cost — 1,000 Customers a Day

Browsing and tapping are free; cost comes only from chat (Google Gemini) and voice (Sarovam). Unit rates: one AI chat message about **Rs. 0.14**; one minute of voice about **Rs. 0.50**. For **1,000 customers in a single day** — a realistic mix where most browse and a share chat or talk — the assistant costs about **Rs. 270 a day**, roughly **Rs. 8,100 – 9,800 a month**.

Cost by service — one outlet, 1,000 customers a day (realistic mix, paid rates after the free tier):

Service	Role (per day)	Per day	Per month
Google Gemini	Chat assistant — ~1,500 messages	~ Rs. 210	~ Rs. 6,300
Sarovam	Voice (speech to text) — ~120 minutes	~ Rs. 60	~ Rs. 1,800
Web hosting	Serves the app	—	~ Rs. 0 – 1,700
Total		~ Rs. 270	~ Rs. 8,100 – 9,800

Monthly cost by how much guests use it — same 1,000 customers a day:

Usage level	What it means	Per month
Light	Most guests just browse & tap; only a few chat or talk	~ Rs. 4,700
Typical	Realistic mix (the breakdown above)	~ Rs. 8,100 – 9,800
Heavy	Almost every guest chats, and many talk	~ Rs. 31,000

Free tiers let a branch pilot at near-zero before any paid spend — Gemini's free allowance covers early volume, and Sarvam includes Rs. 100 of free credit (~200 voice minutes). If the assistant also **spoke its replies aloud** (a fully voice waiter), add text-to-speech: roughly Rs. 0.50–2.50 per guest, about five to ten times the text-reply cost.

Assumptions: about Rs. 95 to the US dollar; one AI message ~ 3,700 input + 150 output tokens (full menu sent as context, conservative). Live rates: Google Gemini 2.5 Flash at \$0.30 / \$2.50 per million input / output tokens; Sarvam speech-to-text at Rs. 30 per hour (~Rs. 0.50 a minute), billed per second. Prices current as of June 2026.

8. Coming Next — The Insight Engine & Dashboards

The next phase makes the assistant genuinely intelligent. A **standard analysis runs identically at every branch**, studying around **50 major factors and trends** across thousands of interactions to see exactly how the business is running, building self-checking tables that hunt for **profit and ideas, not just trends** — and feeding each branch's insights back into the assistant so its recommendations keep sharpening. Supervisors sign in per branch, upload past sales bills as a CSV to seed the system, and keep their branch's info, menu and banquet options current. An **admin dashboard mirrors a copy of every branch's tables** for the brand-wide view. Because the heavy number-crunching is database work and the AI only interprets the summaries, the whole engine runs for only a few thousand rupees a month even at this depth.

Ten examples of what it learns

- **Top dishes by language** — recommend what each audience loves.
- **Best-sellers & top earners** — the heroes to keep stocked and featured.
- **Busiest hours & days** — plan staff and prep; fill quiet hours with offers.
- **Highest-margin dishes** — promote the most profitable plates first.
- **Popular pairings & combos** — build combo deals and smarter upsells.
- **Slow movers** — rework, reprice or retire; cut waste.
- **Dine-in vs takeaway mix** — guide packaging, seating and service.
- **Average order value & upsell success** — the lever to grow each bill.
- **Feedback themes by topic** — fix issues, lean on strengths, per branch.
- **Branch-by-branch comparison** — see which outlet leads and spread what works.

Further ahead: connecting to live billing and payment with the bill sent on WhatsApp, real dish photography, and wider language and device support — each building on the same foundation, so Annapoorna can start simply and grow at its own pace.
