June 2026

Confidential — prepared for discussion with Sree Annapoorna.

1. Abstract

This report presents a proposal by Odysra for a custom, text-based artificial-intelligence waiter built exclusively for Sree Annapoorna. Accessed through a simple QR code placed on each table, the assistant lets a guest ask anything about the menu and receive instant, knowledgeable guidance in their own language. It recommends dishes by taste, mood and budget, explains ingredients, spice levels and dietary suitability such as Jain or no-onion-garlic options, reflects what is available at that moment, answers banquet-hall enquiries, and collects guest feedback.

Every answer is drawn solely from Annapoorna's real menu, so the assistant never invents a dish or a price. Beyond serving the guest, it works as a combined customer-relationship and table-and-menu management tool, turning each conversation into usable insight about what guests actually want. Importantly, the assistant only advises — guests place their order with a human waiter exactly as they do today. The intended outcome is a warmer guest experience, a lighter load on staff, a natural lift in the average bill, and, for the first time, a clear view of customer demand. Tamil and English are supported from launch, with Hindi, Malayalam, Telugu and Kannada ready to follow.

2. Introduction

Good dining is as much about guidance as it is about the food itself. In a busy restaurant the waiter is the bridge between a large menu and an undecided guest — the person who knows what is fresh today, what pairs well, and what a first-time visitor should not miss. Sree Annapoorna has built its name on exactly this kind of warm, knowledgeable hospitality across a wide and much-loved menu. Yet at peak hours, when every table fills at once, even the best team cannot give each guest that individual attention.

QR-code menus have helped guests see the list of dishes, but a static list cannot advise, explain or recommend. Today's artificial intelligence can hold a genuine, helpful conversation — and Odysra proposes to place that conversation on every table at Annapoorna. A guest scans the QR code, a chat opens in their phone browser with no app to download, and they simply ask. The assistant answers from Annapoorna's own menu, in Tamil or English, and points them to dishes they will love.

It is important to be clear about what this is and is not. The assistant is an advisor, not an ordering or billing system. It does not take payments and it does not replace the waiter; guests still place their order with a member of staff as they always have. It sits gently on top of the existing service, built only for Annapoorna and grounded entirely in Annapoorna's menu.

3. Problem Analysis

The challenge is simple to state: a great waiter simply cannot be everywhere at once. As a restaurant gets busier, the very guidance that makes a meal special becomes the first thing to disappear. Four specific problems follow from this.

- **The rush bottleneck.** At peak hours, staff cannot describe every dish to every table. Guests are left to wait or simply guess, and the experience suffers precisely when the restaurant is fullest.
- **Hidden dishes.** Specials, signature items and high-margin dishes stay invisible when there is no one free to mention them. Much of the menu goes unnoticed.
- **Under-ordering.** Guests frequently order less than they would have enjoyed — not by choice, but only because they did not know the options or what would go well together.
- **Tiring and untracked.** Staff repeat the same answers to the same questions all day, which is exhausting; and the restaurant captures none of what guests asked for or wanted. That demand simply walks out of the door.

The net effect is real and recurring: lost revenue from under-ordering, best dishes that never get their moment, a tired team, and no data on customer preferences to learn from. These are not occasional issues — they happen at every busy service.

4. Solution Objectives

Odysra's objective is to give every table a tireless AI waiter: one that knows the entire menu, recommends like the best server on the floor, and helps guests order more — all while easing the load on staff. To meet that aim, the assistant is designed around the following objectives.

- **Know the menu perfectly.** Every dish, price and detail is always at hand, and the assistant answers only from Annapoorna's real menu so it never misleads a guest.
- **Recommend and upsell honestly.** The assistant gently favours dishes that are both well-liked and profitable, but always frames them by taste and value — never by price — so a guest is helped, not pushed. Trust is the priority.
- **Speak the guest's language.** Conversations work naturally in Tamil and English from launch, with Hindi, Malayalam, Telugu and Kannada built to follow — up to six languages in all.
- **Lighten the staff workload.** The assistant fields the endless questions so the team can focus on serving rather than explaining.
- **Capture customer insight.** Every conversation becomes structured information about what guests are asking for and what is in demand.
- **Built only for Annapoorna.** A bespoke assistant tuned to this restaurant — not an off-the-shelf product.

5. Features

From the guest's point of view, the assistant behaves like an attentive, well-informed waiter. Its core capabilities are as follows.

- **Smart recommendations.** Suggests dishes by taste, mood and budget, like your best server.
- **Answers any question.** Explains ingredients, spice levels and dietary suitability such as Jain or no-onion-garlic, instantly.

- **Live availability.** Never recommends a dish that is sold out.
- **Banquet enquiries.** Answers hall questions and captures booking leads around the clock, even when the restaurant is closed.
- **Restaurant information.** Timings, location, parking and seating — all covered.
- **Up to six languages.** Tamil and English now; Hindi, Malayalam, Telugu and Kannada ready to add.
- **Customer feedback.** Collects guest feedback and flags any problem to the manager quickly.
- **Dish photos.** Shows tempting photos so guests order with their eyes.

What makes it different. Unlike a generic chatbot, the assistant is grounded entirely on Annapoorna's real dishes and prices, so it never invents an answer. It is honestly margin-aware, it learns and improves from each conversation and from Annapoorna's existing Google reviews, and it is built specifically for this restaurant. In effect it combines two tools in one: a Customer-Relationship system that remembers preferences and surfaces what guests love, and a Table-and-Menu management layer that reflects live availability and captures enquiries — all through one simple QR chat.

6. Gains for Annapoorna

For the restaurant, the assistant turns everyday guest conversations into measurable advantages.

- **Higher bills, naturally.** When a guest says “something light,” the assistant might reply, “Our Ghee Pongal is a favourite — lovely with filter coffee.” A gentle, genuine nudge lifts the average bill while the guest still feels cared for.
- **Lighter load on staff.** The assistant handles the endless “what's good?” and “is it spicy?” questions, so the team can focus on serving rather than explaining.
- **Never miss a banquet lead.** A wedding or function enquiry at eleven at night is answered and captured — even when the restaurant is closed.
- **Know your guests.** For the first time, Annapoorna can see what guests ask for, what is in demand and what is missing — real data that was never available before.

Expected outcomes. Based on how guided menus and digital ordering typically perform, Annapoorna can expect a gentle, honest lift in the average bill, instant answers for guests even at peak times, more banquet leads captured, and a memorable, modern dining touch that encourages repeat visits. These outcomes are directional; precise figures will firm up during a pilot.

7. Conclusion

The problem this report describes is ordinary and constant: at a busy restaurant, the guidance of a good waiter cannot reach every table, and guests, dishes and data all lose out as a result. Odysra's answer is deliberately lean and low-risk — a single QR code that opens a knowledgeable,

brand-safe assistant, grounded entirely in Annapoorna's own menu and tuned to Annapoorna's way of doing things.

Because it only advises and never changes how orders or payments are handled, the assistant can be introduced with minimal disruption. It promises a warmer guest experience, a lighter load on the team, a natural lift in order value, and a steady stream of insight into what guests truly want. Odysra would be glad to begin with a focused pilot at Sree Annapoorna and to refine the assistant hand-in-hand with the team.

8. Future Ideas

The assistant launches as a text conversation, but it is built to grow alongside the restaurant. Natural next steps include the following.

- **Dish videos.** Short clips so guests see the sizzle, not just a photo.
- **Augmented-reality food view.** Guests point their phone at the table and see the dish in 3D, at life-size, before they order.
- **Voice ordering.** Guests simply talk to the assistant, hands-free.
- **Personalised regulars.** Signed-in guests receive recommendations based on their past visits.

Each of these builds on the same foundation, so Annapoorna can start simply today and expand the experience over time, at its own pace.
